

GET A LEG UP

Student Section _____

Student Name _____

This lesson simulates the fluid shift felt by astronauts upon entering space.

During this lesson, you will

- collect data by measuring the circumference of the leg before and during the simulation.
- use data to explain the changes observed in the circumference of the leg.
- develop a conclusion based upon the results of this simulation.
- compare individual results to class results looking for patterns.

Problem

On Earth, can I determine if I have simulated the fluid shift felt by astronauts when they enter space?

Observation

While on Earth, gravity causes most of the body's fluids to be distributed below the heart. In contrast, living in space with less gravity allows fluids in the body to spread equally throughout the body.

When astronauts first travel into space, they feel as if they have a cold and their faces look puffy. Many astronauts talk about not feeling thirsty because of this fluid shift. The body records this shift as an increase in blood volume. The body takes care of this fluid shift by eliminating what it thinks are extra fluids as it would normally – that's right, through the kidneys – resulting in visits to the restroom. Once this "extra fluid" is flushed from the body, astronauts adjust to space and usually feel fine.

Puffy faces and chicken legs are short-term changes that astronauts feel. Within three days of returning to Earth, the fluid level of the astronauts return to normal, and the body is "back to normal."

In this activity, you will mimic this fluid shift felt in space by staying in a reclined position for a certain amount of time. You will record the effect this position has on your body's fluid distribution.

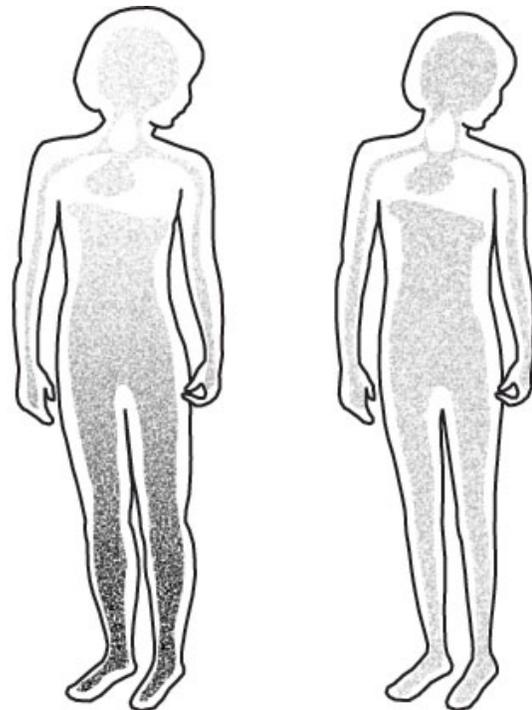

Materials

Per group

- metric measuring tape or string and metric ruler
- washable marker or masking tape

Safety

- Review classroom rules.
- Review lab safety rules.
 - Stay in authorized area.
 - Watch for problems and report unsafe situations immediately.

In Earth's gravity, most of the body's fluids are below the heart.

In space, living with reduced gravity allows the body's fluids to spread more evenly throughout the body.

Use the first column of this KWL chart to organize your observations about how the heart pumps blood through your body. Brainstorm with your group what you want to know about the fluid shift that happens in space, then list in the second column of this KWL chart.

KNOW	WANT TO KNOW	LEARNED

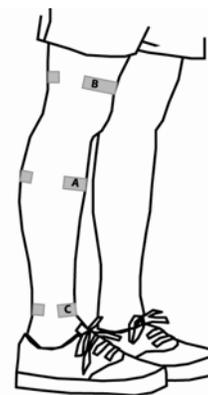

Hypothesis

Based on your observations, write a sentence that will answer the “problem question” with your best guess about what will happen. (On Earth, can I determine if I have simulated the fluid shift felt by astronauts when they enter space?) Your hypothesis should be written as a statement.

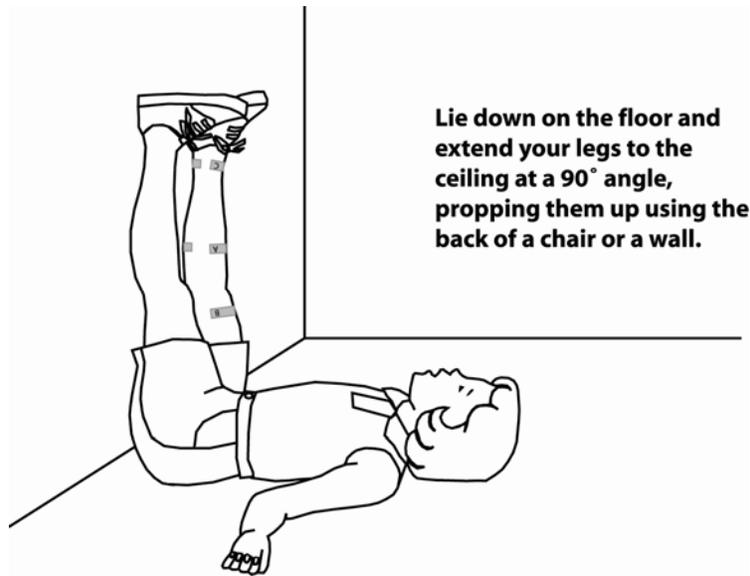

My hypothesis: _____

Test

1. Try to be relaxed and stand for 10 minutes. While standing, do the following:
 - With a partner, identify three places to measure on your bare leg. Make sure one of the places measured is the calf (labeled A on the diagram).
 - Your partner should use a washable marker or small pieces of masking tape to mark the places to be measured on the front and back of your leg. Label these as A, B, C. (See diagram.)
 - Identify these places to measure on the Leg Circumference Data Sheet.
 - Your partner should measure in centimeters (cm) the distance around your leg at each of the three places. This distance is the circumference. Note: Be sure to pull the tape measure or string firmly around the leg, but not so tight that there are “dents” in the skin.
 - **Record all data** on the Leg Circumference Data Sheet. Double check your measurements.
2. Predict what will happen to the circumference of your leg if you lie down for 10 minutes. Record your prediction on the Leg Circumference Data Sheet.
3. Lie down on the floor and place your data sheet, measuring instrument, and pencil close to you. Extend your legs to the ceiling at a 90° angle. Keep both legs raised for 10 minutes, propping them up using the back of a chair or a wall. (See diagram below.)

Label the places you will measure as A, B, and C.

Your partner should remain standing for these 10 minutes.

While your partner is standing, they should identify three places on their own leg to measure, as in step 1 above. If your partner needs additional help, they may ask another person who is also standing for assistance.

4. After 10 minutes, do not stand up. Your partner should remain standing and measure the circumference of all three places on your leg again. Note: Be sure to pull the tape measure or string firmly around the leg, but not so tight that there are “dents” in the skin.
5. **Collect and Record Data** on the Leg Circumference Data Sheet. Double check your measurements. After you and your partner double check your measurements, you may stand up.
6. Repeat steps 2-5 for your partner.

Study Data

After taking all measurements on the Leg Circumference Data Sheet, study the data by answering the following questions.

1. What happened to the circumference of the leg after it was raised for 10 minutes? Why do you think this happened?
2. Compare your results with what might happen to astronauts when they are in a reduced gravity environment.
3. Explain why we call what astronauts look like in space, the puffy face, and chicken leg syndrome. Did you get chicken legs during this activity?

4. How do you think the fluid shift you experienced might affect other parts of your body?

5. Does this data support your hypothesis? Why or why not?

6. How do your results compare to your partner's results? To the class results?

7. Based on your findings, what would you suggest to NASA researchers about helping astronauts overcome the fluid shift while in space?

Conclusion

- Update the LEARNED column in your KWL chart.
- Restate your hypothesis and explain how the results do, or do not, support your hypothesis.

Leg Circumference Data Sheet

Measurement Location	My measurement standing (cm)	My prediction Will my leg become smaller? larger? remain the same?	My measurement reclined (cm)
A calf _____			
B _____ _____			
C _____ _____			

Scientific Investigation Rubric

Activity: GET A LEG UP

Student Name _____

Date _____

Performance Indicator	0	1	2	3	4
The student developed a clear and complete hypothesis.					
The student followed all lab safety rules and directions.					
The student followed the scientific method.					
The student recorded all data on the data sheet and drew a conclusion based on the data.					
The student asked engaging questions related to the study.					
The student described at least one recommendation for NASA researchers to help astronauts overcome fluid shift.					
Point Total					

Point total from above: _____ / (24 possible)

Grade for this investigation _____

Grading Scale:

A = 22 - 24 points

B = 19 - 21 points

C = 16 - 18 points

D = 13 - 15 points

F = 0 - 12 points
